                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein, of the invention. Coding sequences for Box or Brill variants of CC pro-apoptotic Box-related protein can be introduced into cell populations CC to upregulate expression of the proteins in order to induce apoptosis in CC the cell population. This is useful for treatment of diseases where there can ovarian carcinomas, endometriosis, squamous and glandular epithelial CC carcinomas of the cervix. Cell killing induced by Box can be suppressed CC by co-expression with selective anti-apoptotic Bcl-2 proteins. The Box CC protein can be used to elucidate apoptosis mechanisms in reproductive and CC other tissues, and provide a means for manipulating apoptosis. The Box CC protein and transgenic animal are also useful for identifying ligands or CC substrates. Modulation of the gene activity in vivo is useful for CC prophylaxis and therapy of, e.g. cancer and other proliferative CC disorders. Box genes are also useful for identification of cell type based on expression. Identification of Box as a new pro-apoptotic protein CC with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                             This sequence is a mammalian Bok (BC1-2-related ovarian killer)
C protein, of the invention. Coding sequences for Bok or BH3i variants of
C protein, of the invention. Coding sequences for Bok or BH3i variants of
C protein by the protein can be introduced into cell populations
C to upregulate expression of the proteins in order to induce apoptosis in
C the cell population. This is useful for treatment of diseases where there
C is hyperproliferation of reproductive tissue, e.g. uterine, testicular
C and ovarian carcinomas, endometriosis, squamous and glandular epithelial
C carcinomas of the cervix. Cell killing induced by Bok can be suppressed
C by co-expression with selective anti-apoptotic Bc1-2 proteins. The Bok
C protein can be used to elucidate apoptosis mechanisms in reproductive and
C other tissues, and provide a means for manipulating apoptosis. The Bok
C protein and transgenic animal are also useful for identifying ligands or
C substrates. Modulation of the gene-activity in vivo is useful for
C disorders. Bok genes are also useful for identification of cell type
C based on expression. Identification of Bok as a new pro-apoptotic protein
                                                                              Matches
                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein

                                                                                                                                                                                                                                                                                                                                   This sequence is a mammalian Bok (BCl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH31 variants of pro-apoptotic Bok related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein said transfer and amounts after the second context of the cervix of the cervix of the cervix of the cervix of the second context of the cervix 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bok protein; Bcl-2-related ovarian killer; BH31 variant; endometriosi pro-apoptotic protein; apoptosis inducer; hyperproliferation disease; reproductive tissue; uterine carcinoma; testicular carcinoma; cervix; ovarian carcinoma; glandular epithelial carcinoma; cancer; therapy;
                                                                                                                                                                                                                                protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                 Query Match
                                                                                                        is hyperproliferation of reproductive tissue, e.g. uterine, testicular and ovarian carcinomas, endometriosis, squamous and glandular epithelial carcinomas of the cervix. Cell killing induced by Bok can be suppressed by co-expression with selective anti-apoptotic Bcl-2 proteins. The Bok protein can be used to elucidate apoptosis mechanisms in reproductive and other tissues, and provide a means for manipulating apoptosis. The Bok protein and transgenic animal are also useful for identifying ligands or substrates. Modulation of the gene activity in vivo is useful for prophylaxis and therapy of, e.g. cancer and other proliferative disorders. Bok genes are also useful for identification of cell type based on expression. Identification of Bok as a new pro-apoptotic protein with wide tissue distribution and heterodimerisation properties
                                                                                                                                                                                                                                                                                                       This sequence is a mammalian Bok (BCl-2-related ovarian killer) protein, of the invention. Coding sequences for Bok or BH3i variants of pro-apoptotic Bok-related protein can be introduced into cell populations to upregulate expression of the proteins in order to induce apoptosis in the cell population. This is useful for treatment of diseases where there
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ното

                                                              invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; hepatotropic;
antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifugal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences,
                                                                                                                                 Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins AAB58711 - AAB59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the

The invention provides nucleic acid molecules (NAMI) encoding 4 human Bcl-2-like polypeptides (PEPI). The NAMI and BEPI may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Bcl-2-like polypeptides' expression. The NAMI may be used to produce the soluble Bcl-2-like polypeptides by standard recombinant methodolgy. The polypeptides may also be used as antigens in the production of antibodies against Bcl-2 and in assays to identify modulators of Bcl-2 expression and activity. The anti-Bcl-2 antibodies and antagonists may be used to down regulate expression and activity.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from prosophila. The invent useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABLJ0511), expressed DNA sequences (ABLIG175) and the encoded proteins

```
the fusion protein to the target cell and the Bcl-XL domain, which modifies an apoptotic response of the target cell. The fusion protein is useful for modifying (inhibiting or enhancing) apoptosis in a target cell, such as neuron, lymphocyte, cancer, neoplasm, macrophage, epithelial, stem, tumour or hyper-proliferative cell or an adipocyte. It is also useful for reducing apoptosis in a subject after transient ischaemic neuronal injury, especially spinal cord injury. The fusion protein may be used to treat various diseases and injury conditions through inhibition or enhancement of apoptotic cellular response, including neurodegenerative disorders such as Alzheimer's disease, Huntington's disease, spinal muscular atrophy, stroke episodes and unregulated cell growth as in tumours and various cancers. The apoptosis-modifying fusion protein can be delivered effectively throughout the body and targeted to selective tissue and cells.
                                                                                                                                                                                                                                                          The sequence represents the amino acid sequence of LFn-Bcl-XL apoptosis-modifying fusion protein comprising anthrax lethal factor (LF) sequence fused to Bcl-XL. The functional apoptosis-modifying fusion protein is capable of binding a target cell and integrating into or crossing a cellular membrane of the target cell. The apoptosis-modifying fusion protein comprises at least two domains: the DTR domain, which targets
                                                                                                                                                                                                                                                                                                                                                                            Claim 4; Page 64-65; 65pp; English.

The apoptosis inhibitor or the apoptosis promoter can be used as a drug and a diagnostic agent for various diseases caused by apoptosis inhibition or apoptosis promotion. The present sequence represents the human Bcl-2 protein, which is an apoptosis inhibitor used in the exemplification of the present invention.

                                                                                                                                                                                                                          substitutions Y22F, Q26N, and R165K relative to the wild type Bcl-xL protein. The invention also encompasses recombinant vectors and host cells comprising the modified nucleic acid sequence. The mutant Bcl-x protein is able to permeate the cell membrane, thus enhancing its ability to be taken up into a cell and to act as an inhibitor of apoptosis (programmed cell death). Bcl-xFNK and nucleic acids encoding it are useful in remedies for diseases associated with actin in the coll in additional collections.
                                                                                                                                                                                                                                                                                                                                                                                                                      Modified cDNA of rat bcl-x gene and encoded protein with membrane permeability to enhance uptake for effective inhibition of cell deat e.g. apoptosis, useful in remedies for diseases associated with cell
                                                                                                                                                                                                It are useful in remedies for diseases associated with cell death and in additives for maintaining the stability of transplanted cells and organs. The present sequence represents the mittant rest rest
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ohta

                                                                                                                                                                                                                                  The 80-6 mutant (AAW01020) of the bcl-2 oncogene product (AAW01018) lacks amino acids 80-86 of the native protein. This and other Bcl-2 mutants (see also AAW01019-21) were used in a two hybrid assay to examine the interactions between Bcl-2 and novel apoptosis regulating proteins Nipl, Nip2 and Nip3 (AAW00997-99). 2 Motifs (AAW01003-04) on Bcl-2 were identified that are essential for interaction with the Nip proteins. These motifs show homology to motifs (AAW01005-06) identified on the adenovirus E1B 19K apoptosis-blocking protein (AAW01010).
                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding apoptosis regulating proteins - useful for diagnosing and treating immune disorders, malignancies, etc. \,
